## Questions and Answers

Regarding Request for Proposals to Plan, Permit, Construct, and Operate Solar Energy Facility on Property Owned by the Mountains Recreation and Conservation Authority in Los Angeles County

Updated October 6, 2011

- 1. Have any electrical interconnection applications been submitted to Southern California Edison for this particular location? If so – what is the status of the application and has the amount of power the adjacent circuit(s) can accept without circuit/substation upgrades been determined?***

No applications have been submitted. The power capacity of the adjacent circuits has not been determined. The SCE Wilsona Substation is directly across Palmdale Blvd from the project site. The substation's fenced enclosure has ample room for additional equipment.

- 2. We assume that this is not a net-metering project and that instead the power will be sold to a utility company, is that correct? Who do you expect the offtaker of the electricity to be? Have there been any early conversations with the utility about the project?***

Correct, this is a power generation project, not a net-metering project as there are no existing uses on site requiring electricity. SCE's Wilsona Substation is in close proximity to the project site, as are existing transmission lines along both Palmdale Blvd and 230<sup>th</sup> Street East. As mentioned above, no applications to the utility have been submitted at this time. Photos showing the location of both the substation and transmission lines are attached.

- 3. Will the outcome of the Spring 2011 flora/fauna studies be provided to prospective bidders?***

Yes. Biological surveys were conducted over the entire 80-acre property in the spring of 2011 by TeraCor. An abbreviated site analysis will be posted at <http://www.mrca.ca.gov/projectlisting.html> on October 11, 2011.

**4. Should the bidder expect to budget for off-site mitigation costs in the proposed bid price, and if so does MRCA have any idea in what range the mitigation fees might be?**

Yes. There are no known habitat types on site that are expected to require more than a 1:1 habitat replacement ratio. The current replacement ratio for larger Antelope Valley solar projects has not yet approached this threshold. With a maximum 1:1 ratio and assumed 70-acre impact, the theoretical maximum mitigation cost would be \$350,000 (70 acres at \$5,000 per acre). This is an upper limit for mitigation expenses, permitting agencies probably would not require this ratio.

**5. Do you have an approximate project size that you are seeking (in kW or MW)? How much of the available acreage are you looking to cover?**

Utilizing approximately 70 acres of the project site, the MRCA expects to generate approximately 10 MW. Within reasonable ecological constraints, proposals that increase generation capacity (and thus net revenue) will be viewed favorably.

**6. You mention you will consider a variety of funding sources; are Power Purchase Agreements included in that bundle? Also, what is the likelihood of having bonds issued for this development?**

Yes, Power Purchase Agreements are expected to be a primary funding source, although all funding proposals will be considered. Government Code Section 6546 authorizes joint powers entities such as the MRCA to sell revenue bonds for the acquisition and construction of electrical energy generation facilities. The MRCA will consider all options for funding this Project, including the sale of revenue bonds. All proposals, including those relying on the sale of bonds to finance the construction of the Project, will be subject to the approval of the MRCA Governing Board. The MRCA encourages bidders to propose a range of financing and revenue options.

**SCE Wilsona Substation at corner of Palmdale Blvd and 230<sup>th</sup> Street East**
